s find c

C S C S

C

S

What is string slicing?

`find`

Built in python function for finding a specific character in a string.

`s.find(c)`

Returns the index of the first occurrence of `c` in `s`, or `-1` if `c` is not in `s`.

`c` should be a single character string, `s` can be a string of any length.

Examples:

```
s = ‘hello'
s.find('o') ==> 4
s.find('l') ==> 2
s.find('q') ==> -1
```
