# Aim: How do HTML forms work?

## form

An HTML element that can take data from the user and sends it to a cgi script on a server.

Syntax:

```
<form action=script method="GET"> ... </form>
```

### action

The CGI script to send the data to.

### method

How to transmit the data to the server

**GET**: Send the data using a url query string.

**POST**: Send the data inside the actual HTTP request. The information will not be seen in the url, will require slightly different code to parse in your python cgi script.

You can put any html tags inside the `<form>` tag, but there are specific tags for input...
