

How do we work with lists in python?

Unlike strings, lists are mutable (can be modified). You can change and add/remove elements in a list.

To change single elements in a list, use `[]`s

```
g[3] = 'cool'
```

You can change sublists using slicing notation

```
g = [1, 2, 3, 4]
```

```
g[1:3] = [100, 200] ==> [1, 100, 200, 4]
```
