

chמוד

chמודareاopperatormodefile

arear

operator

chmod a+x foo.py

Aim: How can we run python programs directly from the shell?

Changing file permissions

```
$ chmod
```

Command line utility to change permissions

syntax:

```
$ chmod areoperatormode file
```

area

u, g, o or a (all three)

operator

+ or - (for adding or removing permissions)

example:

```
$ chmod a+x foo.py
```

This would give execute permissions to all three areas.

Aim: How can we run python programs directly from the shell?
