

How do we work with lists in python?

Lists

A type of Data Structure (way to store multiple values in a single piece of data).

Lists can store any kind of data, including other lists.

The empty list (`[]`) is a valid list.

Lists can be used like strings in many ways:

- 0 - based indexing using `[]`s

- `len(g)` returns the number of elements in the list.

- Slicing

- Can be combined with +
