

# Aim: How can we get information from web pages?

cgi module

Python module that will receive and interpret query strings.

To use:

```
import cgi  
data = cgi.FieldStorage()
```

Returns a collection where each name in a query string is mapped to its value.

To test if a name is in the query string use in:

```
'year' in data
```

To get the specific value out use .getValue()

```
v = data.getValue( 'year' )
```
