```
turtle

   .color(red, green, blue)
```
Change the color of a turtle, uses the standard RGB color scheme, where each color is an integer in the range [0, 255]

```
   .position()
```
Returns the (x, y) position of the turtle.

Returns a *tuple*, a python data structure that is similar to a list but is immutable. Notably you can use [] to get the individual coordinates.

```
      print( donatello.position()[0] ) #prints
      donatello's x coordinate.
```

Aim: How can we use the python turtle library?
