Aim: How do we write to files?

```
write
```

Like the `read()` function, we can use `write` on a file object to write string data to a file.

First you must open the file for writing like so:

```
f = open('foo', 'w')
```

note the `'w'` argument, this means we are opening the file specifically for writing.

Then use the write function:

```
f.write(s)
```

s must be a string variable or literal.

Lastly, you must close the file or the data may not be written.

```
f.close()
```

Aim: How do we write to files?
