```
turtle
```

Python library that gives you a NetLogo like turtle!

```
turtle.Screen()
```
Creates & returns a screen (window) so that you can see the actions of a turtle.

```
.exitonclick()
```
Method to run on a screen object so that the program quits.

Generally, always have this at the end of a python program that uses turtles:

```
window = turtle.Screen()
window.exitonclick()
```

Aim: How can we use the python turtle library?
