type name value

Aim: How do HTML forms work?

```
input
```

html tag to store data in a form

```
<input type="type" name="name" value="value">
```

```
name
    The name for the data to be sent, this is the same as the name of a
    parameter in a query string.
```

```
value
    The value to send with the associated name.
```

```
type
```

Sets what kind of input element you want

```
text:
```
 basic text box

```
submit:
```
 submit button, signals the webpage to send the form to the server cgi script, very important to include in a form.
